Zixing Li

I listened to the speech of Kevin Doerksen which is talk about BC emergency health services. He also talked about the steps to be a scientist. The steps are being intentional, talking to people, asking questions, connecting myself to the data science community and taking control of my learning path. Which means that choosing a degree program that puts me in a position to become a data scientist, choosing electives that round out my knowledge of related fields and strongly considering taking a co-op. When we confuse with choosing what kind of jobs, we need thing about what do I want to be and what problems do I enjoy solving. He introduced some problems that they need to fix, which is how they arrange the ambulance, cause even one second is important for the patient. The things that I learned from this speech is not just the skills of working or life, it is I need to do something for the society when I am working or when I have some money.
